

The Orango National Park (Portuguese: Parque Nacional de Orango) is a protected area in Guinea-Bissau. It was established in December 2000.[1] The park has an area of 1,582 km² (611 sq mi), which is partly marine.[2] It covers the southern part of the Bissagos Archipelago, notably the islands Orango, Orangozinho, Meneque, Canogo and Imbone, and the surrounding sea. The marine area does not exceed 30 m (100 ft) depth.[1] The park is administered by: Instituto da Biodiversidade e das Áreas Protegidas da Guiné-Bissau (Biodiversity Institute and Protected Areas of Guinea-Bissau). About 160 km² (60 sq mi) of the park is covered by mangroves. It plays a crucial role for the reproduction of molluscs, fish and sea turtles.[1]

On the mainland, palm trees (*Elaeis guineensis*) are most noticeable, as well as savanna shrubs and sandy shores. It is also the main habitat of the African gray parrot (*Psittacus erithacus*) which is an otherwise endangered species in the subregion.[citation needed]
